

Hansc & Co.

Sustainability & Innovation – Circular Economy model

Starting from professional shirt manufacturer, Hansc & Co. possesses over 20 years of experience in garment industry, and has hundreds of well-known clients all over the world. The category of product contains a various range, including formal shirt, casual shirt, functional shirt, multi-purpose shirt, and has gradually become more complete.

In recent years, global climate change has already had observable effects on the environment, the shortage of raw materials and awareness of environmental protection accelerates the changing of production technology. As a result, in 2019 Hansc & Co. takes a series of actions to innovate our product.

First of all, we use sustainable materials, such as the Polyester fabric which is made from recycled PET bottles. Regarding the marine conservation issue, we collect the old fishing net and transform it to the Nylon fabric. In addition, we combine the discarded oyster shells and recycle PET bottles, turning it into the Seawool fabric.

Inside the factory, we circulate energy in a smart way. For example, we gather rain water and filter it to the service water for daily usage. The power of the factory comes from burning cutting waste instead of coal. By doing so, we convert the heat energy to power, providing the needed by the factory.

Now, we keep developing eco-friendly products and make an effort to take corporate social responsibility. Create a sustainable and circular economy model, to reach the goal that humans coexist with nature peacefully.
